13th International BUILDAIR Symposium:

New insights on measuring methods, airtightness in existing buildings and ventilation efficiency

Early-bird discount until 14th of April

The 13th International BUILDAIR Symposium in Hanover on June 2-3, 2023 has been recognized as training event by the German Energy Agency. The leading conference for building airtightness focuses on the efficiency of ventilation systems, airtightness of existing buildings and specific measuring methods. Participants can catch the early bird discount by registering until the 14th of April.

Airtight building envelopes have been a standard feature of new buildings for years. But what about the existing buildings? How much energy is lost when using ventilation systems? How can you locate a hidden mold infestation? What is the best practice when measuring buildings with flexible airtightness layers? Can you combine historical systems with new technologies? The 13th International BUILDAIR-Symposium will focus on these topics of current relevance, and much more. For all the information visit www.buildair.eu.

Participants in the leading conference for building airtightness will be granted twelve training lessons by *dena* for extending their listing in the energy efficiency experts directory. Apart from profiting from the latest know-how and *dena* recognition, there is a third good reason for not missing the symposium: A trade show will be hosted next to the assembly hall where participants will find detailed and free information about products and services on airtightness and ventilation systems.

The early bird discount is valid until the 14th of April. Thanks to the symposium sponsors, BlowerDoor GmbH, Springe, and pro clima Moll bauökologische Produkte GmbH, Schwetzingen, we were able to keep the conference fee at an affordable level. As in previous years, the Energy and Environment Center on Deister (eu [z.]) will host the conference.

Conference office: phone +49 5044 975-20

The Organiser:

Energie- und Umweltzentrum am Deister (Energy and Environmental Centre, e.u.[z.]

Founded in 1981, the Energy and Environmental Centre e.u.[z.] provides a wide range of information and advice on energy efficient and resource-saving construction for professionals in the building sector, energy consultants and all other interested people. Its ambition is to share immediately implementable, practical knowledge about airtightness, building physics and renewable energies via workshops, seminars and conferences. Its own centre is used in a sustainable manner, and includes three buildings of different ages, energy standards and methods of construction, ideal for demonstrations. Groups and individuals can book catered and uncatered stays in the low-energy Guest House (constructed in 1991, woodframe method), and hold Training events in the Passive House (2001).
